Algorithm Animation makes a number of original and useful contributions: it describes models for programmers creating animations, for users interacting with the animations, for "script authors" creating and editing dynamic documents, and for "script viewers" replaying and interacting with the dynamic documents.

3 The Expectation-Maximization Algorithm The EM algorithm is an efficient iterative procedure to compute the Maximum Likelihood (ML) estimate in the presence of missing or hidden data. In ML estimation, we wish to estimate the model parameter(s) for which the observed data are the most likely.

The animation system provides an alternative: by adding a few more print statements to the program, we can produce input for the animation system, thus providing a dynamic display of the sorting process. Furthermore, we can use graphics as well as text, to give a more visual presentation of the algorithm.

Keywords: Algorithm-animation, Software-visualization, Narrative 1 INTRODUCTION An animation of an algorithm is a visualization of the changes performed by the algorithm on data over time [19]. One can distinguish between two different purposes for algorithm animation and software visualization in general. The first is didactic and the sec-

language, resulting in a unique approach to algorithm animation, e.g. a seamless integration of algorithm animation into the language and on-the-fly exploratory programming of an algorithm animation. An area related to VP is programming by demonstration (PbD). In PbD, a person demonstrates an example or an operation of a task, and the PbD-
