Chemotrophs are organisms that obtain energy by the oxidation of electron donors in their environments. These molecules can be organic (chemoorganotrophs) or inorganic (chemolithotrophs). The chemotroph designation is in contrast to phototrophs, which use solar energy. Chemotrophs can be either autotrophic or heterotrophic. Chemotrophs are found in ocean floors where sunlight cannot reach them ...

Stafilokoki (znanstveno ime Staphylococcus) so rod grampozitivnih, negibljivih in nesporogenih aerobnih ali fakultativno anaerobnih kokov (okroglih bakterij) v grozdastih skupinah, ki lahko povzročajo gnojna vnetja in sepse, vendar je večina vrst za človeka nenevarnih in so del normalne bakterijske flore na koži in sluznicah. Prisotni so povsod po svetu in predstavljajo tudi manjši delež ...

The genus Pseudomonas described in 1894 is one of the most diverse and ubiquitous bacterial genera which encompass species isolated worldwide. In the last years more than 70 new species have been described, which were isolated from different environments, including soil, water, sediments, air, animals, plants, fungi, algae, compost, human and animal related sources.
